In this assignment students will learn about AWS API Gateway to create RESTFul APIs.

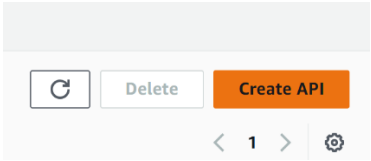

1. We will start to create a simple Hello World API with one method (GET)
    a. First, we need to create the lambda function:

Note: Use the LabRole from the course Learning Lab.
It will be created a new lambda function named HelloWorld with the following code:

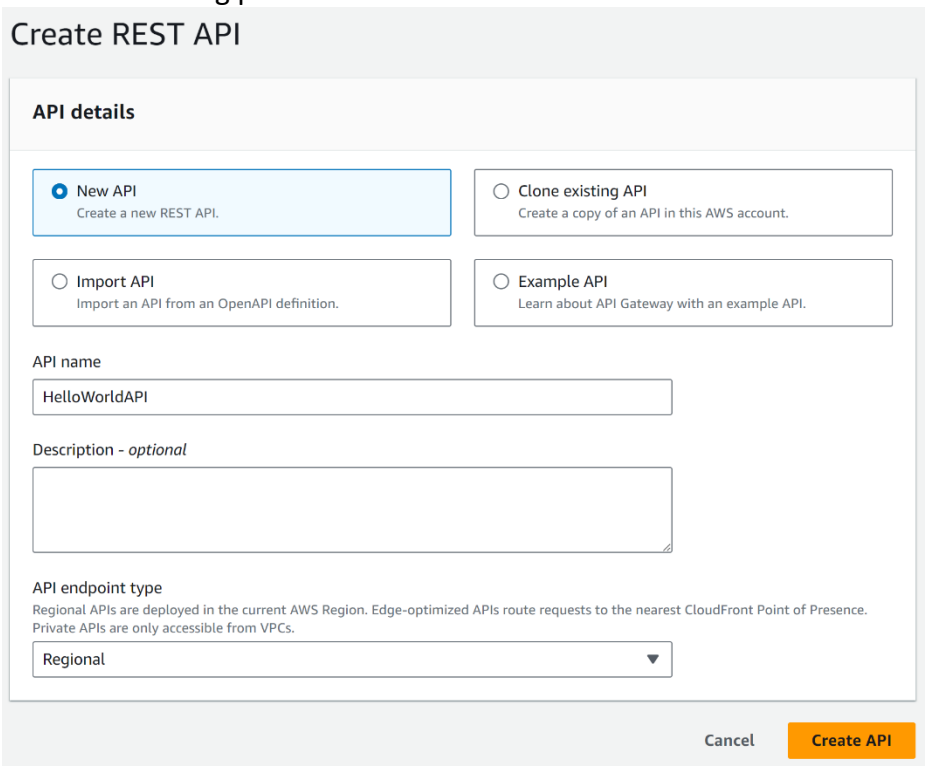

b. Then go to “API Gateway” service
c. Go to “Create API” button

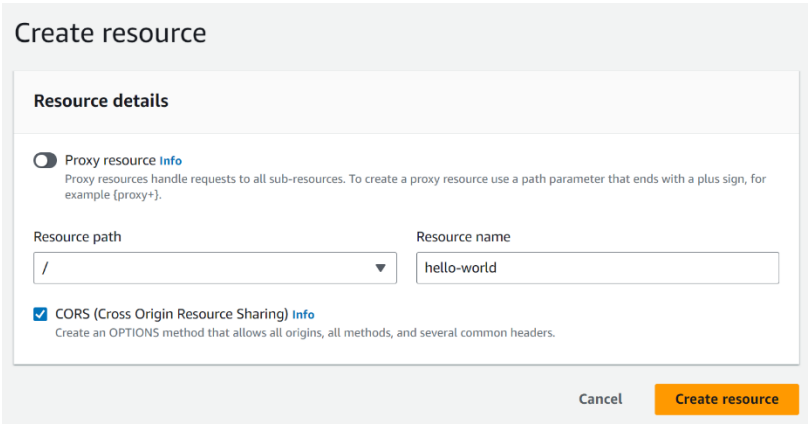

d. Use the “REST API” and press “Build”

e. Use the following parameters:

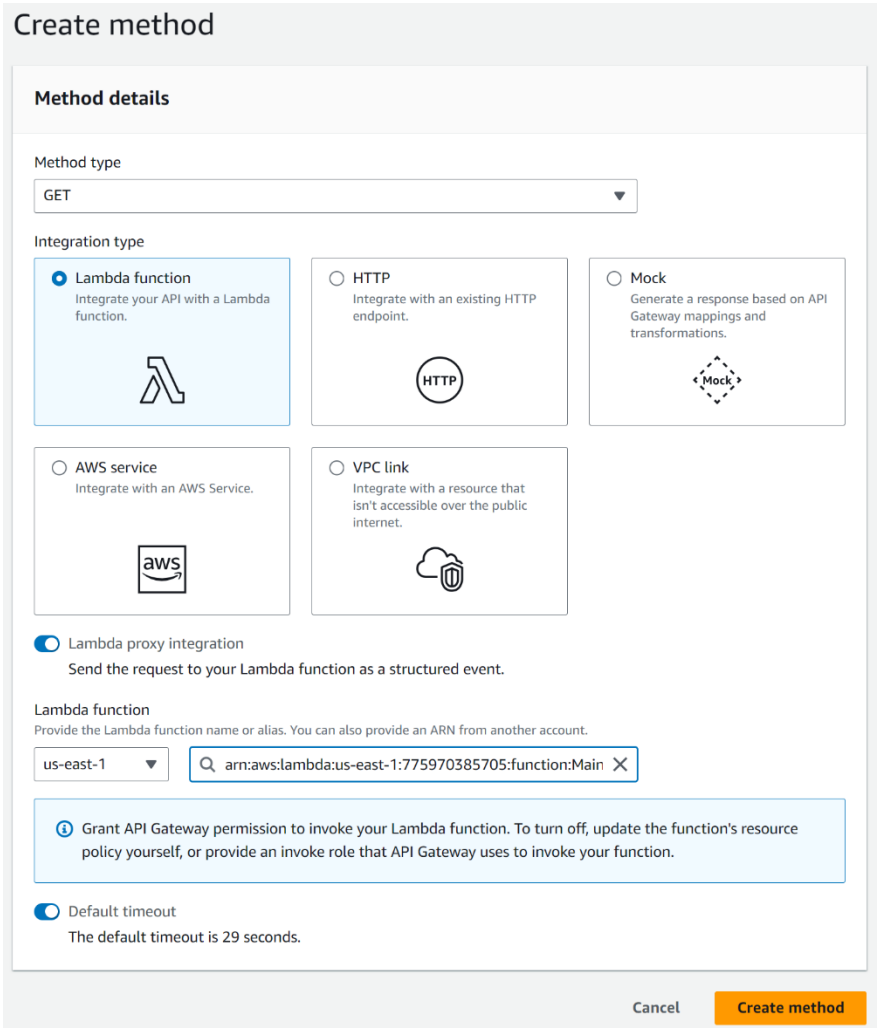

It will be created an API with the message “Successfully created REST API 'HelloWorldAPI”

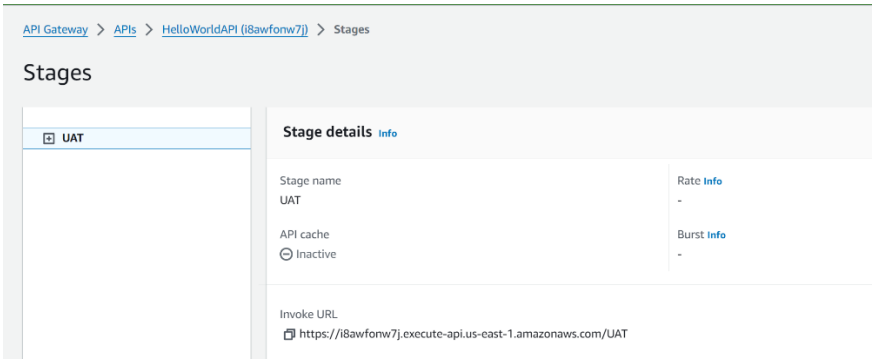

f. Now, we will create a new resource. For this press “Create resource”:

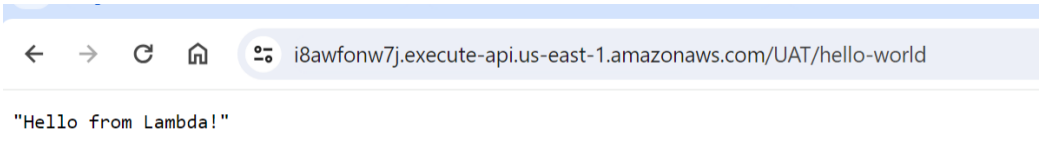

g. And now we will create a new method using GET. For this, use the previously created Lambda Function.

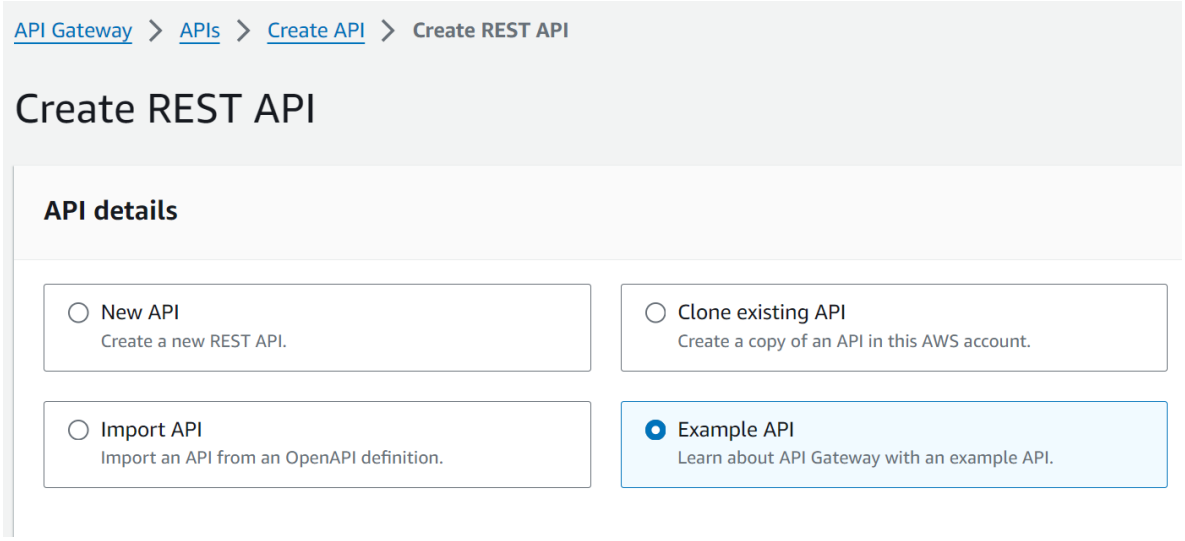

h. Finally, deploy the API using the button “Deploy API”. You can create associated to a stage (e.g. DEV, UAT, PROD, etc).
i. You can check the URL to invoke:

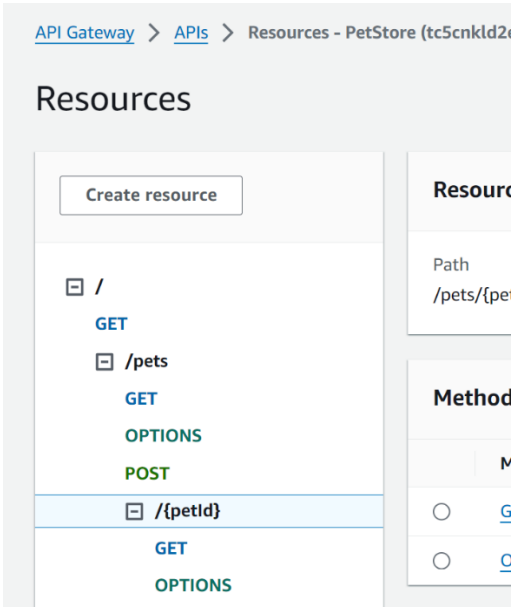

E.g. https://i8awfonw7j.execute-api.us-east-1.amazonaws.com/UAT/hello-world

2. Create a new API using the Example API

Try to invoke the deployed API and the methods and resources available:

Can you understand how to get the “petID” in a lambda function?
