In this assignment students will learn about databases in AWS.

1. AWS Postgres

   Create a new database Postgres. For this assignment you can use the “sandbox” from the Cloud Foundational Course.

To create the database, you can use the free tier option without backup and the Public IP option available to you be able to connect outside of AWS network.

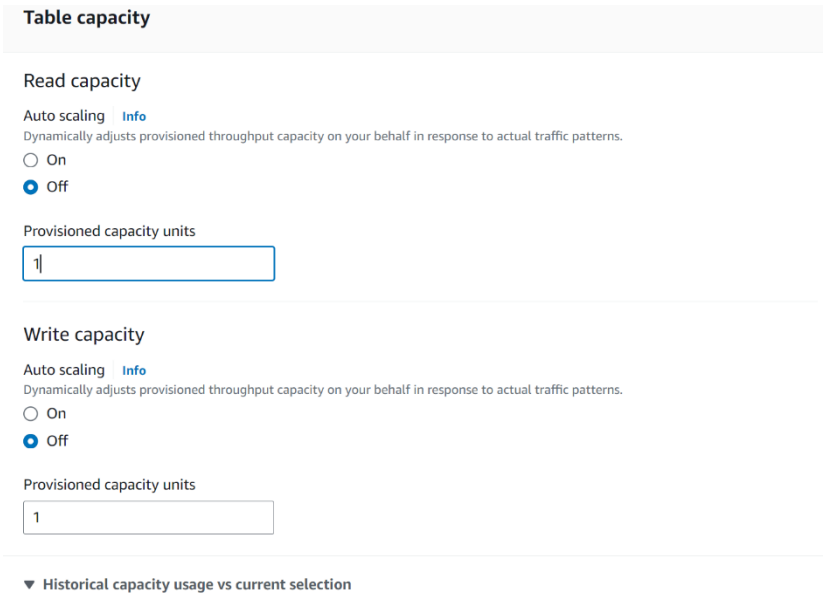

To connect to the database from your laptop you will need to change the security group to add your IP:

2. AWS DynamoDB

2.1 Create a new table under DynamoDB service.

To reduce the monthly cost you can change the default settings of reading and writing capabilities:

2.2 Try to create a lambda function that creates a table programmatically.

Hint1: You will need to change the execution role to “LabRole”.

Hint2: You can use the code from “create_table_lambda_function.py” from here:

2.3 Try to create a lambda function that insert info into a table programmatically.

Hint1: You can use the code from “insert_table_lambda_function.py”:

2.4 Try to create a lambda function that queries info from the table.

Hint1: You can use the code from “query_table_lambda_function.py”.

2.5 Try to create a lambda function that deletes information from the table.

Hint1: You can use the code from “delete_table_lambda_function.py”:

2.6 The previous code already has an HTTP Status code 200 in case of success. Try to create a REST API that triggers the query function. For this you can use the service “API Gateway” from AWS.
